Audit of skills for working at

PHP Developer

Main goal:

Create a module in Laravel which will do search of products/items. It should include a search form. After entering the product name it should show the list of matching results.

Each product/item should have the following parameters:
- ID (id)
- Image (image_url)
- Name (product_name)
- Category (categories)

Tasks:

1. Use openfoodfacts API - https://world.openfoodfacts.org/cgi/search.pl?action=process&sort_by=unique_scans_n&page_size=20&json=1 to display products/items on the page (add pagination here as well)
2. In front of each entry add a button/link, by click on which data will be saved to DB (or updated in case it has been already saved before)
3. Cover your code with functional/unit tests

Tech stack:
- PHP (last version)
- Laravel (last version)
